Compared with the traditional gravity systems, these Vacuum units offer the following advantages:

- Construction cost saving (small trenches)
- Small pipes diameters
- Booster pumps stations no longer required
- No sediments and clogging in the pipeline
- No leakages and smells, as the line is kept under vacuum
- Low energy consumption

The system is composed by: collection pits with valve, vacuum pipeline and vacuum station.

We are able to make the engineering and the supply for the complete system (pipeline and vacuum pits design up to the vacuum station).
